HKUST BUSINESS SCHOOL 香港科大商學院 | WORLD CLASS IN ASIA

ISOM 2010
Introduction to Information Systems

Project Information Session

From Problem to Prototype

ALL RIGHTS RESERVED © 2026 Zhitao Yin

Feature launch meeting: Decision

Metric	A	B	Change
Completed task	18%	23%	+5 points
Notification opt-out	3%	7%	+4 points

A: 1 reminder

B: 3 reminders

Your team (4-5 students)

1 State an initial ship, revise or stop decision.
2 Write the strongest argument against your own decision [Ship, change, or stop?].

Midterm Exam

Week	Date	Topic
1	Sept 1	Course overview
	Sept 3	Digital economy (1)
2	Sept 8	Digital economy (2)
	Sept 10	Digital economy (3)
3	[redacted]	
	Sept 17	E-commerce (1)
4	Sept 22	E-commerce (2)
	Sept 24	E-commerce (3)
5	Sept 29	E-commerce (4)

Midterm and Final Exams

The midterm and final are the two big checkpoints to make sure you're really understanding the ideas we cover in this course.

- The exams will focus on **conceptual application** rather than memorization and will not be technical in nature.
- You may bring **one A4-sized cheat sheet**, double-sided, handwritten or printed.
- There will be **no make-up exams** for either the midterm or the final.
- No separate sample exam paper or question bank will be provided; selected in-class questions may illustrate how course concepts could be assessed.

	Date	Time
	06 Oct 2026 (Tue)	19:00-21:00

Location and more logistics info to be announced by TA via Canvas later.

Today’s project roadmap

Part	What you will understand
1. Project expectations	What to build, what to submit, and how it is assessed
2. A real commercial app	Need, design, adoption, continued use, and value
3. Build and explain	AI workflow, a real app demo, evidence, and Q&A
4. Work and continue	Teamwork, learning resources, portfolio, and startup

You are a product team: making decisions, building, and testing.

Useful in product management, business analysis, consulting, and entrepreneurship.

The assessed deliverables

Team	4–5 students from the same course session
Recorded submission	MP4 video, no more than 10 minutes
Presentation session	Live Q&A after the video
Group list due	15 September 2026, 23:00 [Randomly formed groups tend to receive lower score.]
Video due	10 November 2026, 08:00

The group project is 25% of the course grade.

No separate pitch deck or written report is required.

How the project is assessed

Criterion	Weight within the project
Problem definition and importance	25%
Solution generation and prototype	25%
Evaluation of effectiveness	25%
Application of course concepts	10%
Prerecorded video and demonstration	5%
Live Q&A	10%

Group members normally receive the same score.
Video timing does not change the rubric weights.

A working prototype: type, click, inspect

Example: turn a customer letter into a PDF

1. Type a real message

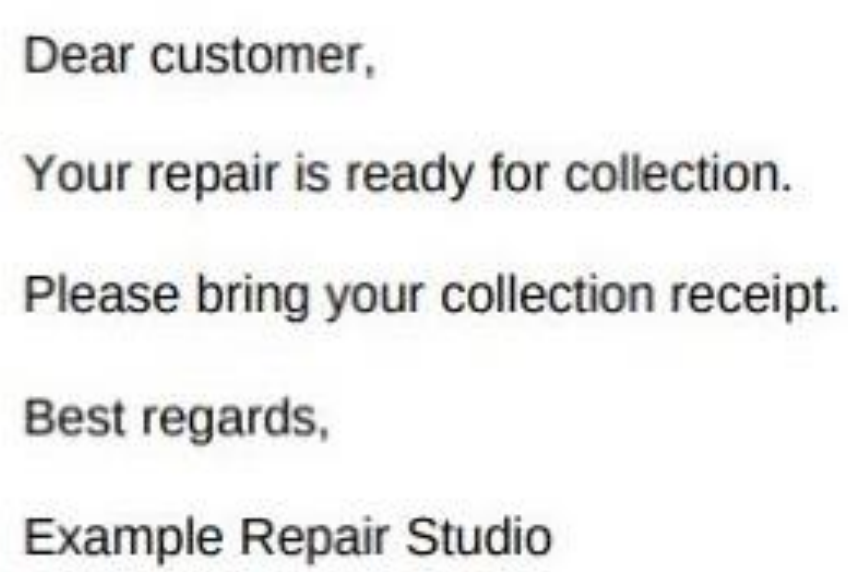

“Your repair is ready
for collection.”

2. Click “Preview PDF”

3. Check the result

Are your words there?

Actual PDF preview (enlarged detail)

Actual app output, 12 September 2026. Sample letter. Printing and delivery were not tested.

Commercial problems: a few examples

These illustrate how to narrow a problem. Your field is open.

Example user	Example business task	Possible evidence
Small retailer	Find items that need restocking	Owner interview and permitted sales records
Freelancer	Track unpaid invoices and follow-ups	A freelancer’s current workflow
Service business	Prepare a quote from agreed requirements	Staff and anonymized sample requests

Choose a commercial context where you can reach users and test the need.

Examples only—not a required industry list or evidence of demand.

Novelty and feasibility

Weak proposal	A stronger claim to investigate
“We combine chat, calendar, shopping, and AI.”	A specific user completes an important task better than today.
“Nobody has ever done this.”	We compared existing alternatives and identified a meaningful gap.
“Our AI can do anything.”	This function runs on these inputs. Here are the result and limits.

An app drawer already combines apps. Your contribution needs a reason to exist.

Real example: PrintPigeon

A digital app. A very physical letter.

A letter to send

An online order

Printing + post

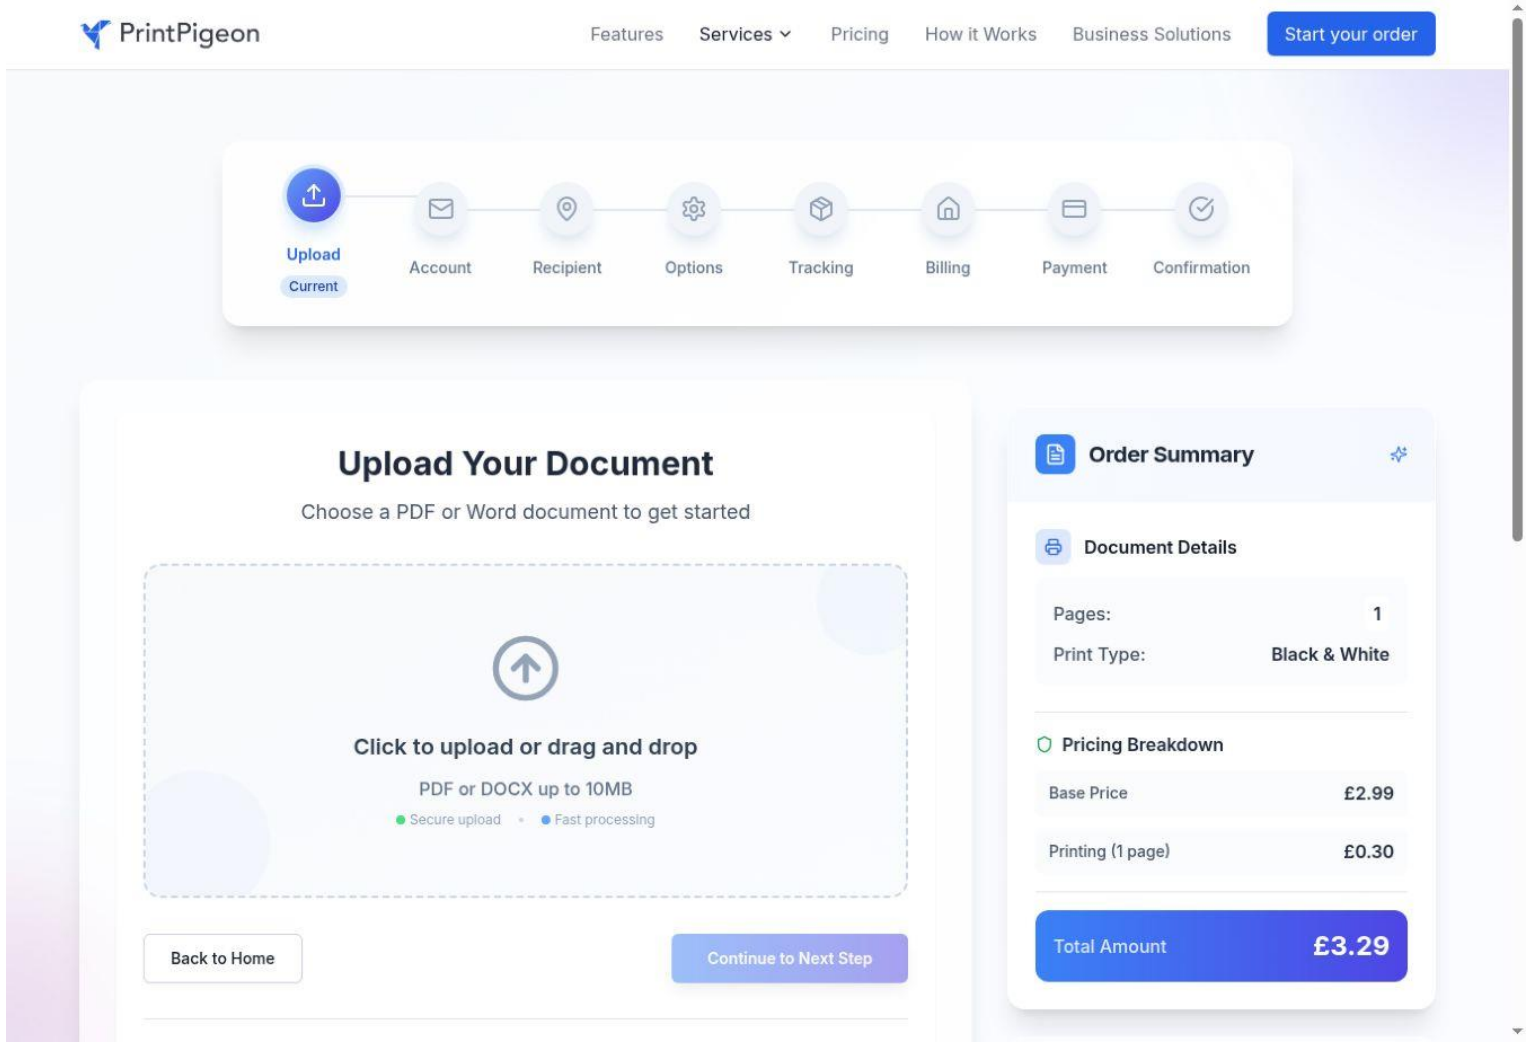

A recipient

Watch the official product video

Founder's AI build story

Service illustration. Actual app screens follow. The founder reports using Lovable.

The actual order interface

One visible task

Upload a document.
Review the order.
Continue through the steps.

Design question

Where might a first-time user hesitate?

Actual public interface, 12 September 2026. Screen appearance does not verify fulfillment.

Market research during product development

Founder’s starting point

He needed to post documents without a printer or a convenient post office.

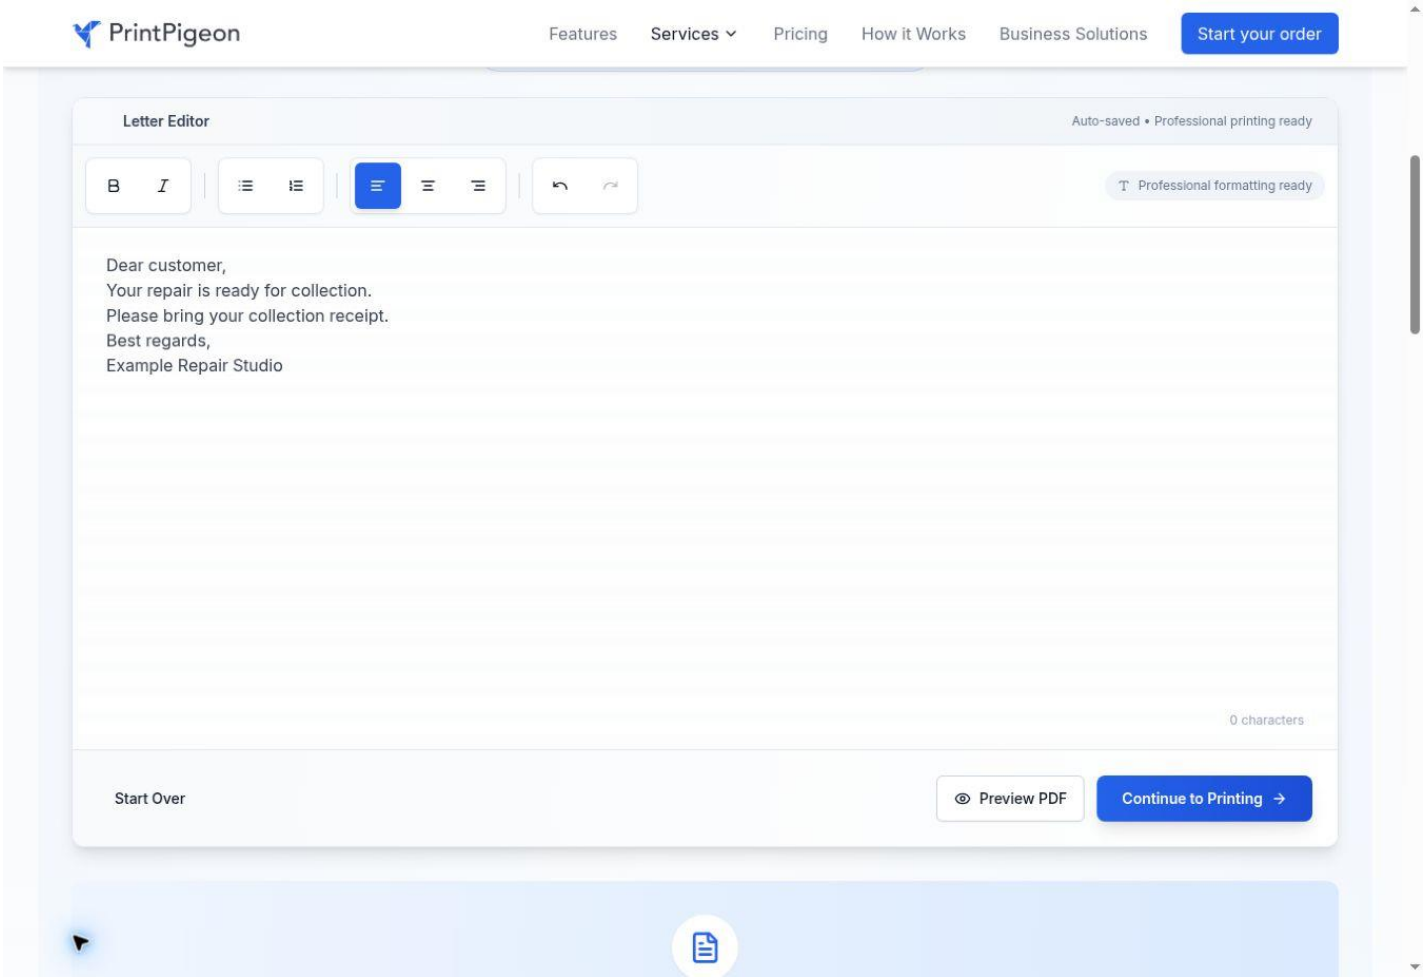

Your team’s evidence

Discuss the last real task.
Observe the current workaround.
Compare existing alternatives.
Let users try an early version.

For a small firm: who sends letters, how often, and at what cost?

A founder’s frustration starts a question. Research establishes who else has it.

Every feature needs a user reason

Visible features

An online editor
A PDF preview
A path to printing

Reasons to investigate

Less setup effort?
Fewer formatting mistakes?
More confidence to proceed?

The feature-to-need links are teaching hypotheses. Users must test them.

Adoption and the cold start

Reach the first users	Choose 1 segment and a channel where the need is visible.
Deliver the first value	Let a user complete 1 useful task with little setup.
Reduce hesitation	Explain the cost, required data, and what happens next.

Founder’s account: search ads first, then location-specific search pages.

Here, cold start means finding initial users. A network effect is not required.

Continued use follows a recurring need

For business mail, the next mailing task is the return trigger

Design question	Evidence your team could collect
Why would the user return?	Observe the next relevant task over a stated period.
What keeps the task dependable?	Record failures, correction effort, and support needed.
What measure fits the frequency?	Repeat completed tasks among users with another need.

Proposed evaluation. No retention rate is available in the cited case materials.

Value for whom?

Stakeholder	Potential value	Evidence needed
Staff member	Less preparation and travel effort	Total minutes per completed mailing
Business owner	Lower cost for dependable delivery	Full cost, errors, and reliability
Recipient	Correct document at the needed time	Accuracy and receipt evidence
Service operator	A viable operation	Revenue less delivery and support costs

Value depends on both the app and the operating process.

Teaching value hypotheses. These are not measured PrintPigeon outcomes.

Evidence that matches the claim

Claim	A suitable check	A limit to report
“People can use it.”	Observe unassisted task attempts.	A usability test cannot establish retention.
“It saves effort.”	Compare equivalent tasks with the current method.	Include setup, correction, and order effects.
“People will keep using it.”	Track later completed tasks.	State the period and eligible users.
“It works reliably.”	Test expected and difficult inputs.	Report failures as well as successes.

Report actual participants, results, and limitations. AI-generated users are not evidence.

What makes the app feasible

Dependency	What a credible team shows
Data	Actual inputs, access, and how errors are handled
Core mechanism	A running function with a result you can inspect
External service	A real connection or an explicit boundary
Operations	Who completes any human step, and whether it was tested

A “Sent” screen cannot prove that a letter was mailed.

Mock data can support a demo. Mock capability cannot support a core claim.

Building starts in the first project week

Investigate and scope	Use early evidence to define a small task and success criteria.
Build a small version	Ask AI for 1 complete working journey.
Try it yourself	Check real actions, errors, storage, and outputs.
Revise with evidence	Describe the failure, fix it, and repeat the check.

AI helps with implementation. Your team owns the product decisions and claims.

A prompt that specifies a working task

Example practice task: a freelancer’s quote calculator

Build a web app where a freelancer enters service items,
quantities, and unit prices. Calculate line totals and the total.
Allow editing and deleting items. Save and reopen a draft.
Generate a printable quote from the same data.
Reject negative quantities and missing item names.
Explain where the draft is stored and how to test each function.

Acceptance check: changing a quantity updates every related total.

Illustrative learning exercise. This idea still needs its own market research.

What the team should be able to demonstrate

Demonstration	What it establishes
Change an input and inspect the result	The core logic responds to the user.
Save, reload, and reopen	The claimed storage behavior works.
Try a wrong or missing input	The app handles a realistic failure.
Let another person operate it	The journey can work beyond its builder.

A good-looking success message is a starting point for checking.

Your video: a real prototype demonstration

Suggested time	What the audience should see
0:00–1:00	Team, target user, problem, key market evidence, current alternative
1:00–7:00	Operate the real app: inputs, core actions, visible results, and a changed input or failure case
7:00–9:30	Evaluation and actual results, adoption / cold start, continued use, value, limits, and contributions

During the demo: explain feature choices and relevant course concepts.
Show test evidence where it helps explain the result.

Suggested 9:30 structure. About 6 minutes of real app use. Maximum: 10:00.

A recording people can follow

Explain the situation	One concrete user and task before the first click.
Record real app use	Show connected actions and results in a functioning app.
Connect action to reason	“This preview lets the user inspect the output.”
Show the evidence	A small result table and what changed after testing.

Your prototype is the main character. The cinematic logo can have a short cameo.

Q&A: a direct answer with evidence

“How do you know users will keep using it?”

“We observed [actual repeat-use evidence] over [period].
That supports [limited conclusion] for [these users].
We have not established long-term retention.
Our next test would observe the next relevant task.”

Answer the question, support the claim, and state the boundary.

Resources for the next task

If you need to…	Start with…	Appendix
Understand users	Interview guide and evidence table	32–33
Build and publish	AI quick starts, prompts, checks	34–37
Evaluate and record	Test plan, metrics, videos, and tutorials	38–42
Work and continue	Team templates, portfolio, startup support	43–48
Check past topics	Earlier proposals and ways to distinguish your problem	51–65

Choose 1 tool and complete a small working task before adding more.

More demo and recording tutorials: 66–68. No paid tool is required.

Teamwork with visible commitments

For each output	Agree on…
Owner	Who is responsible for delivering it?
Reviewer	Who independently checks that it works?
Definition of done	What can another teammate inspect or use?
Due date and access	When will it be ready, and where can everyone find it?

Weekly review: a working journey, evidence learned, and the next commitment.

When a commitment is missed

**“We agreed to have the upload function ready on Tuesday.
It is missing, and user testing depends on it.
What is blocking it? What can you deliver by Thursday?”**

Disagreement about the idea	Compare user evidence, feasibility, and a small test.
Repeated non-contribution	Record facts, try a repair, and seek help early.

In extreme cases of persistent non-contribution, the instructor may adjust that individual’s score. The team cannot change anyone’s grade.

Engineering friends can help

Bring a prototype and a specific question

“Can you help us check whether our saved quotes survive a page refresh? Here are the steps and the result we get.”

Useful help	Feasibility, architecture, debugging, or code review.
Your responsibility	Understand the result, test it, and credit the contribution.

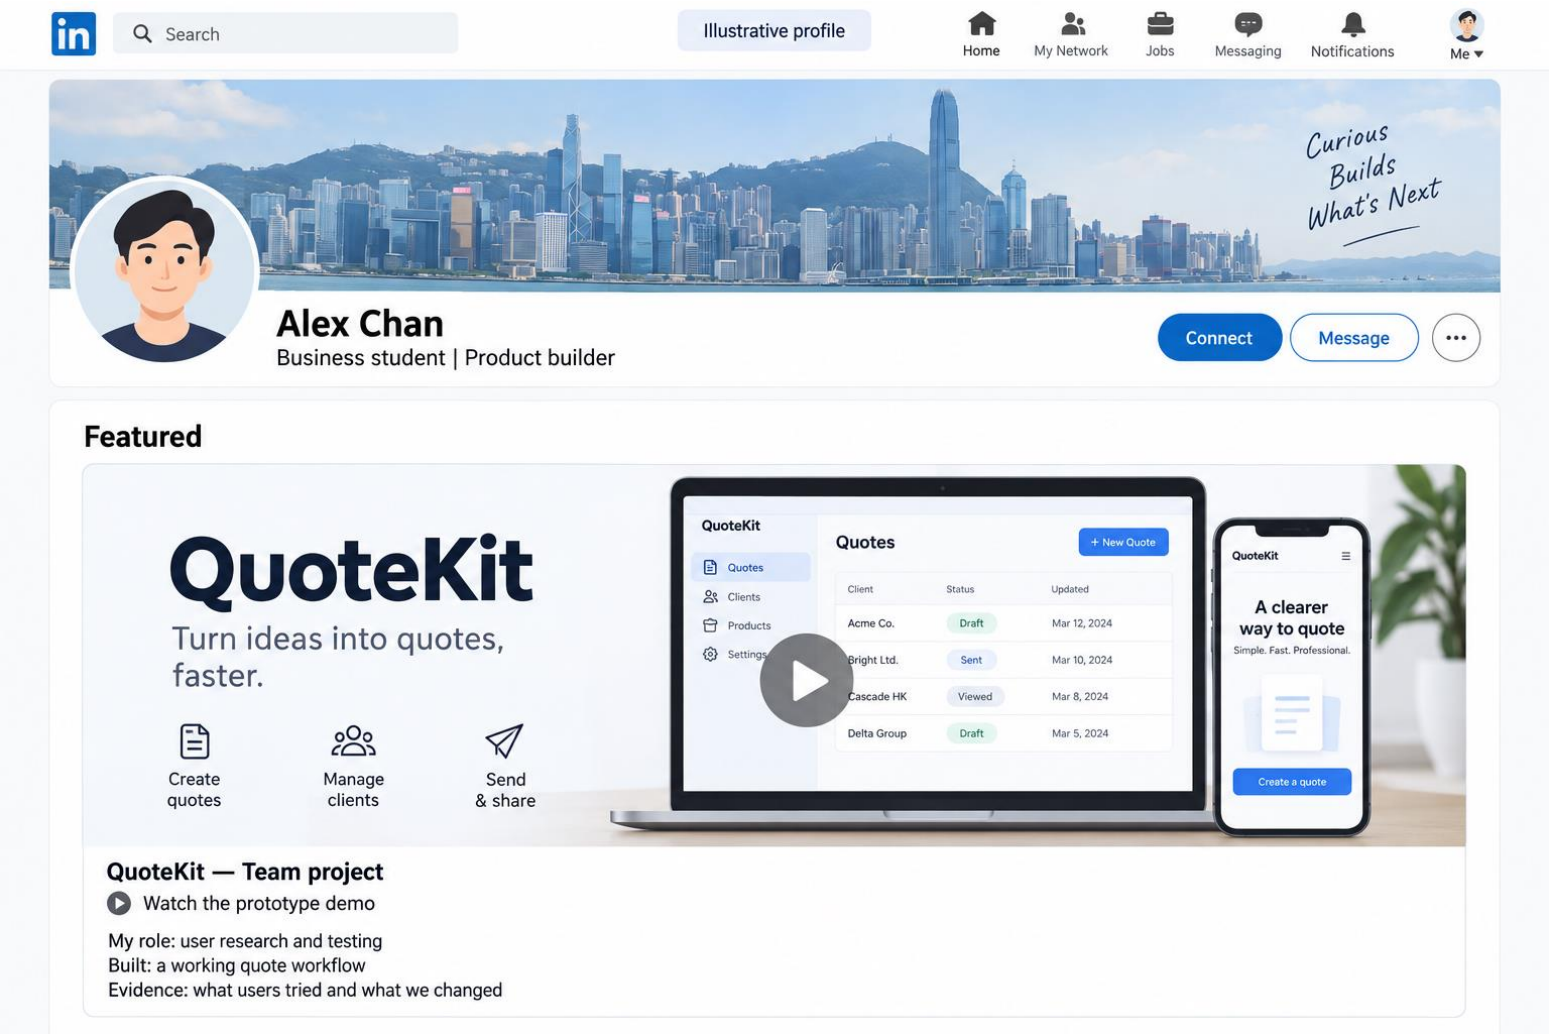

A suggested schedule: research while building

When	Learn from users and evidence	Build and test
16–25 September	Observe a real task. Check past topics and alternatives.	Build and run the smallest core function with AI.
26–30 September	Let a target user try it. Record friction and demand.	Revise the journey. Check data and key dependencies.
1 –18 October	Collect task evidence and repeat-use feedback where feasible.	Improve the app weekly. Save results and failures.
19 Oct–1 Nov	Compare with the current method. Explain the limits.	Fix core issues. Capture the demo and test evidence.
2–9 November	Check that the story matches your actual evidence.	Finalize the MP4. Rehearse Q&A and check playback.

Start building in week 1. Continue research, development, and testing together.

Suggested milestones. Formal video deadline: 10 November 2026, 08:00.

A project you can show on LinkedIn

Let people see the work

A demo they can watch

Your specific contribution

Evidence and what changed

Illustrative profile and fictional project. Use your own work, real evidence, and team agreement.

After the course: try a real pilot

The last class can be the first version.

Your prototype	A real pilot	The next version	Startup advice
A task that works	Observe actual use	Improve from evidence	Explore the next step

HKUST Entrepreneurship Center: Advising Counter

What your project should make clear

A real need	Market evidence and a meaningful gap in current alternatives.
A real product	A working core task with feasible dependencies.
A reason to use it	Initial adoption, continued use, and value for specific people.
A credible explanation	Actual results, honest limits, and shared team understanding.

A small app can become a portfolio piece, a useful service, or the start of a company.

Resource appendix

Next task	Reference slides
Market research and problem definition	32–33
AI building, deployment, and debugging	34–37
Evaluation and course concepts	38–39
Demo examples, recording, and storyboard	40–42, 66–68
Team agreement, conflict, and technical help	43–45
LinkedIn, HKUST support, and startup learning	46–48
Submission rules and final checks	49–50
Past student topics and distinct problem selection	51–65

Self-study pages. Online links checked 12 September 2026. Past topics supplied by the instructor.

Reference: learning about users

User interviews: a beginner's guide

Nielsen Norman Group · Learn to ask about real experiences and separate interviews from usability tests.

Suggested questions for a commercial user

1. Walk me through your most recent [task].
2. Where did it take extra effort or go wrong?
3. What tools or workarounds did you use?
4. Who chose the solution, and who paid for it?
5. What would make changing the current method difficult?

Output: observed needs, current alternatives, and assumptions still to test.

Reference: a market evidence table

Question	Record in your team's working notes
Who has the problem?	Role, situation, task frequency, and recruitment method
Why does it matter?	Actual examples of time, cost, errors, or missed opportunities
What happens today?	Manual workflow, current apps, and doing nothing
What is the gap?	A specific unmet need and evidence against each alternative
What remains uncertain?	Buyer, demand, access, feasibility, and willingness to switch

Evidence entry: source / date / observation / interpretation / limitation

Your video can show selected evidence. This table is not a separate submission.

Reference: AI tools for building

HKUST GenAI access information

Use university access to scope, generate code, and explain errors. Hosting is a separate step.

Lovable Quick Start

Follow the guided build-and-preview workflow, then replace the sample with your own task.

Replit: Build your first app

Try a second route if it fits your access and project. Complete a working task before expanding.

Accounts and usage limits vary. Check the current plan before spending money.

Reference: a complete starter prompt

Practice example: a simple quote app for a freelancer

Create a working web app for drafting a client quote.
Inputs: item name, quantity, unit price, and client label.
Calculate each line total and the grand total from those inputs.
Support adding, editing, and deleting items. Validate missing names and negative or nonnumeric values.
Save and reopen a draft in this browser. Explain that storage limit.
Generate a printable quote using the same data.
Use sample client labels. Do not add real payments or email sending.
Explain the inputs, logic, output, storage, and failure cases.
Give us steps to verify every claimed function.

Adapt the task to your research. A working calculator alone does not establish novelty.

Reference: data, access, and deployment

Lovable: Publish your project

Learn how to publish a version and share a usable link. Test it outside the builder preview.

Lovable: official video tutorials

Use the relevant lessons for editing, data, and integrations after your core task runs.

Before sharing a prototype

Check what data it stores and who can see it.
Keep API keys out of browser code and recordings.
Open the shared version on another device and repeat the core task.

Reference: debugging with AI

A precise repair request

Observed: [exact steps, input, and result].
Expected: [the correct result].
Fix this problem while preserving the other working functions.
Explain what changed and which checks we should repeat.
Do not claim a test passed unless you actually ran it.

Team check: reproduce the issue, review the change, and run it again.

Save a working version before a major change.

Reference: an evaluation plan you can use

Decision	Fill in before testing
Claim and target users	Who should improve, on which task, and compared with what?
Success and guardrails	Completion, effort, correctness, and what must not worsen
Method	Observed use, benchmark, comparison, or use over time
Evidence	Actual participants, attempts, dates, and failures
Interpretation	What the results support, what they do not, and the revision

After testing: retain the original results and explain what changed.

Reference: course concepts—an example menu

Choose concepts that explain a real project decision.

Possible connection	A decision it could help explain
Adoption, continued use, and value	Why try it, return, or change the current workflow?
E-commerce and FinTech	Where do trust, payment, or transaction friction matter?
Platforms, network effects, and crowds	Does value depend on others, reputation, or collective input?
AI and different types of analytics	Which prediction, recommendation, or test improves a decision?
Web3 and cybersecurity	Who should verify a record or control access—and why?

Illustrative and non-exhaustive. Revisit as the semester progresses.

Do not add a concept for its name. Connect it to your design, evidence, or trade-off.

Reference: watch a product in action

Talk

See

Google DeepMind: Project Astra

Watch the capability demonstration.
Connect visual context to a concrete task.

Fix

Loom: a 1-minute Blur demo

Follow a visible action and correction.
Borrow its clarity for your own demo.

Official demo pages. Historical launches are examples of communication, not course standards.

Reference: choose a recording method

Screen + voice

OBS Studio: Quick Start

Record the app and microphone.
Good for a focused, continuous task.

Screen + face

Clipchamp: screen recorder

Show the app with a small camera view.
Edit the recording on a timeline.

A quick Mac capture

Apple: record your screen

Use Shift–Command–5 or QuickTime.
Select the microphone before recording.

Slides + narration

PowerPoint: Record a presentation

Explain context and results around your real app recording.

More methods and editing lessons: 67–68. Final submission must be an MP4, ≤10 minutes.

Reference: your video storyboard

Suggested time	Screen or evidence to prepare
0:00–1:00	Team, specific user and problem, key research evidence, current alternative
1:00–7:00	A screen recording of the working app. Show a complete task, real results, and a changed input or failure case.
7:00–9:30	Actual evaluation findings and limits. Briefly explain adoption, continued use, value, contributions, and next step.

Most of the video shows real app use. Explain design reasons and relevant course concepts alongside the actions and evidence.

Target 9:30. Maximum 10:00. Timing is guidance. Rubric weights stay the same.

Reference: your team working agreement

Agree on…	Write down…
Goal and scope	The core task, the boundaries, and realistic time commitments
Communication	Where decisions live and the agreed response time
Work ownership	Output, owner, reviewer, date, and completion criteria
Shared access	Prototype, source files, research evidence, and versions
Decision process	How to compare choices and resolve a remaining disagreement

Atlassian: Working Agreements

Atlassian: Roles and Responsibilities

Waterloo: Making Group Contracts

Reference: common team conflicts

Situation	A useful response
Different product ideas	Compare user evidence and feasibility. Test a disputed assumption.
Different quality standards	Define what “done” means using a visible result.
Uneven work or a missed deadline	Name the missing output, understand the blocker, and reset the commitment.
Only one person understands the app	Have another member run the task and explain the data flow.
Persistent non-contribution	Keep records of commitments and attempts to resolve it. Seek help early.

Waterloo: Four common group project challenges

Reference: asking an engineering friend

A focused request

“We are building [task] for [user].
Here is the prototype and the behavior we observed.
We need help with [one technical question].
Our constraints are [time, data, access, and budget].
Could you suggest the smallest realistic solution and a way to test it?”

Afterward: record the advice, your decision, the test, and the contribution.

Reference: a LinkedIn project description

A template using your own evidence

Our team built [app] for [specific users] to help them [task].
My contribution was [research, design, code, testing, or analysis].
We used [AI tools] to assist with [specific work].
In [actual test and sample], we observed [honest result].
We changed [feature] because [evidence].
The current version supports [working scope].
Next, we plan to test [important uncertainty].
Demo: [your own project link]. Team: [credit with permission].

Share your own work with team agreement. Remove private data and course materials.

Review an additional route for digital ventures, with its own selection and eligibility rules.

Start with a customer and a testable next step. Check current programme requirements.

Reference: submission rules

Requirement	Course rule
Group	4–5 students from the same session
Video	MP4, no more than 10 minutes
After the video	Live Q&A
Group list	15 September 2026, 23:00
Video submission	10 November 2026, 08:00
Late deduction	Within 24 h: 30%. Over 24–48 h: 60%. Over 48 h: 100%.

Group members normally receive the same score.

Project: 25% of the course grade. No separate report or pitch deck.

Reference: before you submit

Content	Brief context, substantial real app demo, actual evaluation, and honest limits.
Truthfulness	Working functions, simulated data, and future work are distinguishable.
Team understanding	Every member can explain the main decisions and limitations.
File quality	MP4 plays fully, screens are readable, audio is clear, duration ≤10:00.
Delivery	The correct final version follows the announced submission process.

Past student projects: a topic history

Use earlier projects to find a different user problem

What the archive contains	14 topic categories with examples of past proposals and analyses.
What it tells you	What students explored. It does not verify working features or outcomes.
How to use it	Compare the closest past ideas, then identify an unmet task or context.
What to avoid	Repeating a proposal with a new name, extra features, or an AI label.

Topic history: slides 52–65. Percentages follow the supplied summary, rounded to 1 decimal.

Past topics: health and wellbeing

Share in the supplied topic summary: 18.6%

Connected healthcare

Patient-controlled records, online consultations and reminders. AI support for record standardization and diagnosis.

Older and disabled users

Location-alert watches, missed-dose pillboxes, volunteer matching and assistive-equipment recommendations.

Exercise support

HealthMe: exercise and meal plans with movement feedback. Other ideas used fitness pods and workout partners.

Mental wellbeing

Mood journals, AI conversations, calming virtual spaces and peer support, with referrals in selected concepts.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: fashion and beauty

Share in the supplied topic summary: 17.2%

Styling and fit

Outfit advice and virtual try-on using body measurements or wardrobe photos, including shops for specific users.

Beauty advice

Skin-image analysis, cosmetics recommendations, virtual makeup and routines tailored to lifestyle or weather.

Rental and resale

Wear&Share: clothing rental. Luxury resale concepts proposed product histories, chips or image-based authenticity checks.

Design and production

SuitCraft: AI-assisted suit design and cutting optimization. Other ideas used shopper voting to guide production.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: food, dining and nutrition

Share in the supplied topic summary: 12.7%

Meals and cooking

Mealy: portioned ingredients, recipes and videos. Other ideas covered prepared meals, cloud kitchens and home cooks.

Personalized nutrition

Meal and supplement plans from user preferences or goals, with substitutions, tracking and nutritionist consultations.

Food provenance

Trace & Trust: product histories and independent verification. Farming concepts recorded chemical use and certifications.

Sourcing and shopping

Direct supplier purchasing, group buying, organic marketplaces and baking bundles with delivery coordination.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: finance, payments and insurance

Share in the supplied topic summary: 10.8%

Payments and transfers

Remittances, crypto payment gateways and payroll, using shared records and checks to address costs or late payments.

Insurance services

Insurer analyses, plan comparison and claims support using verified documents, connected-device data or AI screening.

Financial decisions

WealthCraft: family financial education. Other ideas covered risk-based investment advice and subscription tracking.

Accessible banking

JamieAI: guidance for seniors using digital banking, with clear visuals, voice or face authentication and fraud alerts.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: arts, entertainment and hobbies

Share in the supplied topic summary: 10.3%

Games and fan communities

Tradable game assets, player voting, retro-console shops and fan merchandise with resale or community activities.

Creative tools and markets

AIVA business analysis. LEGO instructions, art commissions, font search and digital-art authentication proposals.

Events and experiences

Activity-booking marketplaces and event tickets with authenticated access, secure resale and merchandise entitlements.

Sports analytics

ForesAIght: esports scouting from match data. Another idea matched school sports teams with sponsors using analytics.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: education, careers and campus life

Share in the supplied topic summary: 7.4%

Personalized learning

Language feedback and questions from notes. Skill Mentor: lessons and social-skills support for special educational needs.

Careers and recruitment

CV feedback, interview simulations and career tasks. Employer screening with verified credentials and candidate records.

Finding study spaces

Campus maps and library heatmaps using occupancy signals, with forecasts, seat recommendations and reservations.

Managing study resources

Adaptive study planners. BookLoop: textbook exchange using course-and-edition listings and reputation feedback.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: business services and digital trust

Share in the supplied topic summary: 4.4%

Supply-chain software

Configurable blockchain services for small businesses, combining cloud access, cleaning, tracking and analytics.

Marketing partnerships

Customer-data marketing analysis. Lynk: brand–creator matching, compensation, contracts, escrow and campaign tracking.

Operations and security

AI-assisted CCTV incident summaries and alerts. Network maps that identify cable faults and create maintenance orders.

Privacy and digital rights

Compliance tools, privacy dashboards with virtual cards or disposable email, and watermarks linked to reuse monitoring.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: transport and logistics

Share in the supplied topic summary: 4.4%

Parking and driving payments

ParkSmart: parking-availability prediction. Another concept combined license-plate recognition and RFID for driving charges.

Sharing vehicles and chargers

Gonow: ride hailing, carpooling and car rental. Electricshare: booking and pricing for privately owned EV chargers.

Delivery and baggage tracking

Shared shipment records and RFID for parcels, sensitive logistics data and airline baggage delivery to hotels.

Used-car purchasing

A vehicle marketplace with verified histories, AR showrooms and optional insurance or rental services.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: sustainability and resource sharing

Share in the supplied topic summary: 3.4%

Selling surplus food

SurplusShare: discounted unsold food from shops or restaurants, with inventory updates and pickup or delivery.

Preventing household waste

FreshSave: receipt-based pantry records and expiry reminders. FreshSense: camera logging and spoilage prediction.

Managing business food waste

Waste-Wise: smart-bin readings and ingredient data to identify losses at different cooking stages in restaurants and hotels.

Recycling incentives

Plastic Rebirth: plastic tracking, rewards and resale involving artists. GreenUs: individual and district green-action rewards.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: housing and home

Share in the supplied topic summary: 2.9%

Property and roommate matching

House in One: direct property transactions and VR viewings. UniShare HK: landlords and lifestyle-compatible roommates.

Interior design

ASIA: room designs from text prompts, matching furniture and augmented-reality placement previews.

Furniture for small homes

Adjustable furniture designs, recycled materials, AR previews and collection of customers' old furniture.

Packing and storage

BestFit: scans of belongings to suggest efficient arrangements, packing instructions and guidance for later retrieval.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: travel and hospitality

Share in the supplied topic summary: 2.5%

Planning group trips

T-Butler: group preferences, bookable itineraries, adjustments for weather or traffic, and video souvenirs.

Booking hotels

HOTELLIGENCE: a hotel-booking concept with shared room inventory, personalized recommendations and crypto payments.

Travel records and rewards

BookChain: identity and travel-record wallet. FourU: exchanging loyalty points across airlines, dining and hospitality.

Immigration and settlement

Flight of Migrants: eligibility checks, visa-application help, settlement services and study or career recommendations.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: pet care

Share in the supplied topic summary: 2.0%

Specialist supplies

PExoTic: an exotic-pet marketplace with local shops, detailed search and urgent or bulk delivery.

Care information and appointments

Lovetiles: a reptile and amphibian supplies website prototype with care guidance, chatbot support, booking and community posts.

Support for new dog owners

PetPulse: short-video analysis, veterinary records, possible health-risk flags and access to brief vet consultations.

Connected pet monitoring

PetSense: collars, cameras and feeders linked to behavior analysis, meal plans, wellbeing reports and training guidance.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: shopping and consumer services

Share in the supplied topic summary: 2.0%

Discovering small local sellers

Ask Jason: a local-brand marketplace with discovery pages, product categories, verified-buyer reviews and delivery tracking.

Ordering customized products

CustoMYze: buyer–maker design consultation and gift orders, with 3D previews and AI originality checks.

Designing phone cases

iCreateAI: AI-generated phone-case designs, different customization levels and sustainable-material orders.

Student secondhand trading

Tandem: verification videos, automatic listings, wish-list matching and university endorsements to improve buyer trust.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Past topics: social connection and community

More reliable dating

Bubble: verified profiles and preference quizzes, with no-show reporting to address unreliable arrangements.

Networking and follow-up

NameDrop: group QR codes for profile exchange, relevant-contact suggestions, profile summaries and follow-up reminders.

Access to welfare and opportunities

BridgeUp: multilingual benefit-eligibility checks and applications, plus training and verified-job recommendations.

Historical proposals and analyses. Functional claims were not verified in this topic summary.

Reference: more demos and useful formats

PrintPigeon: an app connected to an offline service

Watch the product introduction. Then explain which parts your own team has actually implemented.

OpenAI: expressive voice and everyday situations

Try a short playful clip such as “Dad jokes.” Notice how one situation makes a capability understandable.

Y Combinator: successful application videos

Watch Zenefits or Teespring for a concise team-and-problem opening. This is a different assignment format.

Borrow a clear storytelling technique. Your own video still needs the real app and evidence.

Reference: recording skills you can practise

Loom: screen recorder

Try a quick screen-and-camera draft to rehearse. Check duration and MP4 export access before relying on it.

Clipchamp: how to screen record with audio

Learn tab, window, or screen capture with audio. Record a short task, then inspect the result.

Clipchamp: video tutorial training center

Choose the screen-and-camera recorder lesson, then practise trimming and arranging your own footage.

Start with a 20-second test. Choose one route. Check current accounts, limits, and export options.

Reference: make the demo easy to follow

One task. A readable screen. A human voice.

Watch: how to create picture-in-picture videos

Keep the presenter small so the app remains visible.

Explore: Clipchamp editing video lessons

Practise a trim, a caption, or a brief before-and-after comparison.
Use these to clarify an actual task, not to invent a successful result.

Try building: Google AI Studio app workflow

A playable app is the starting point. Editing makes its real behavior easier to understand.
